

TIP101 Problem Set Validator Guide

Hello students! We have created a validator tool that covers all breakout room problem set questions. This will provide you with a method to check your solutions during breakout rooms or individual practice. Once you set this up, you can use it for the rest of the semester!

Video Tutorial

 [Walkthrough Video](#)

Setup Instructions

1. Download the ZIP file linked above.
2. Extract it into a new folder (double click, or right click and choose extract/unzip)
3. Open that new folder in VS Code.
4. You will see all of the **student** files organized by unit and session.

 **Important:** Please do not edit any of the validator files, as they are required for the tests to run correctly.

How to Use the Validator

The validator logic does not contain any solutions. Instead, it includes verified input/output test cases to check your code.

 This follows real-world software engineering practices using **Test-Driven Development (TDD)**.

-  Each problem file includes the problem description and the **UMPIRE scaffolding** to help you plan your solution.
- Replace the `pass` statement with your own code.
-  When you're ready to test your solution, click the **Run File** () button in the top-right corner of VS Code.
- Your test results will appear in the Terminal.
-  Add your own custom test cases to catch additional edge cases and improve your coverage!
